

Christian Obanaka

Software engineer · Futures trader

PORTFOLIO · 2026

Designing clear products for traders.

Product design, interface systems, and frontend implementation grounded in firsthand trading and prop-firm experience.

Recent role	Software Engineer · Tradara
-------------	------------------------------------

Independent build	trackmyprop
-------------------	--------------------

Specialism	Trading + fintech products
------------	-----------------------------------

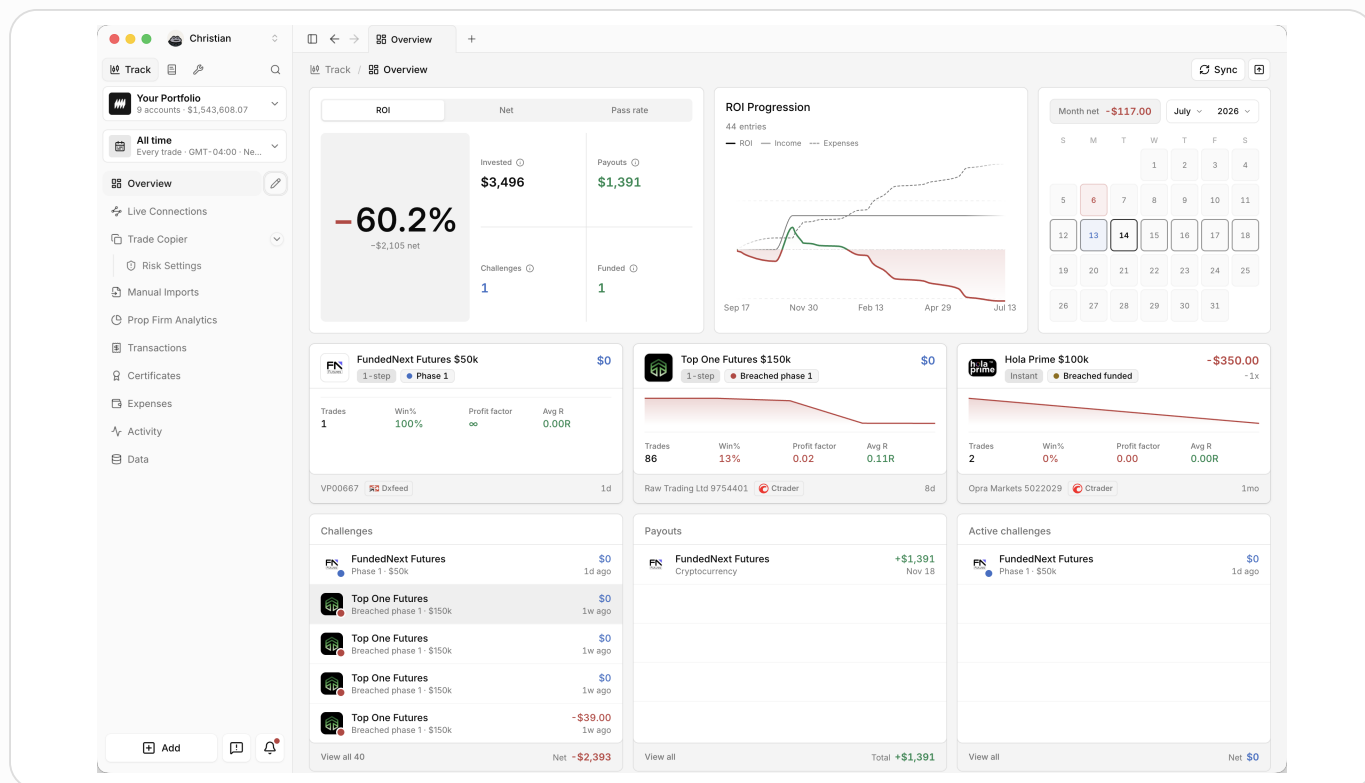

Practice	Product design + engineering
----------	-------------------------------------

CURRENTLY

Building trackmyprop · Futures trader

One workspace for the operational side of trading.

A desktop-first product for traders managing prop-firm accounts, rules, trades, journals, costs, and payouts.

Role

Product direction, UX/UI, implementation

Platform

Electron desktop app · macOS + Windows

Audience

Prop-firm and futures traders

State

Private beta · active development

The problem

Serious prop-firm trading work is fragmented across broker platforms, spreadsheets, notes, calculators, and support conversations. The design challenge is to make that complexity visible without making the product feel complicated.

Connected workflows, one shared language.

Track Portfolio, live connections, accounts, prop-firm journeys, transactions, expenses, and records.

Journal Trade history and review tools connecting executions to daily and longer-term context.

Tools Consistency, payout, challenge, and win-rate calculators plus an economic calendar.

System Navigation, search, reusable data surfaces, shared actions, and connection-status patterns.

The screenshot displays the 'Day review' interface, which includes a title bar, a toolbar, and three data cards. The title bar shows 'Day review' and a close button. The toolbar contains various editing and utility icons. The first card, titled 'Calm little day trading Asia -> MNQU6 BUY +\$427.65', shows trade details for a specific entry. The second card, titled 'Jun 26, 2026', shows daily performance metrics. The third card, titled 'June 2026', shows monthly performance metrics and a progress bar.

Day review

Calm little day trading Asia -> MNQU6 BUY +\$427.65

MNQU6 BUY +\$427.65 Win

#3850431576254492000 · Jun 26, 2026 · No account

Size 3 Held 13m Entry → Exit 29,695.75 → 29,767.5

Source removed

Jun 26, 2026 +\$5,329 Green day

11 trades · 6W / 5L

Trades 11 Win rate 55% Best +\$3,984 Worst -\$1,386

June 2026 +\$1,879 Up month

22 trading days · 312 trades

Trades 312 Win rate 37% Best day +\$5,329 Worst day -\$1,722

The journal links reflection to real trade, day, and month data instead of separating notes from performance context.

Clarity under pressure.

01

Stable desktop hierarchy

Persistent navigation, tabs, filters, and compact data surfaces support repeated daily use without turning every metric into a promotional card.

02

Rules explained as decisions

Calculators pair results with inputs, thresholds, and next required amounts so traders understand why a status changed.

03

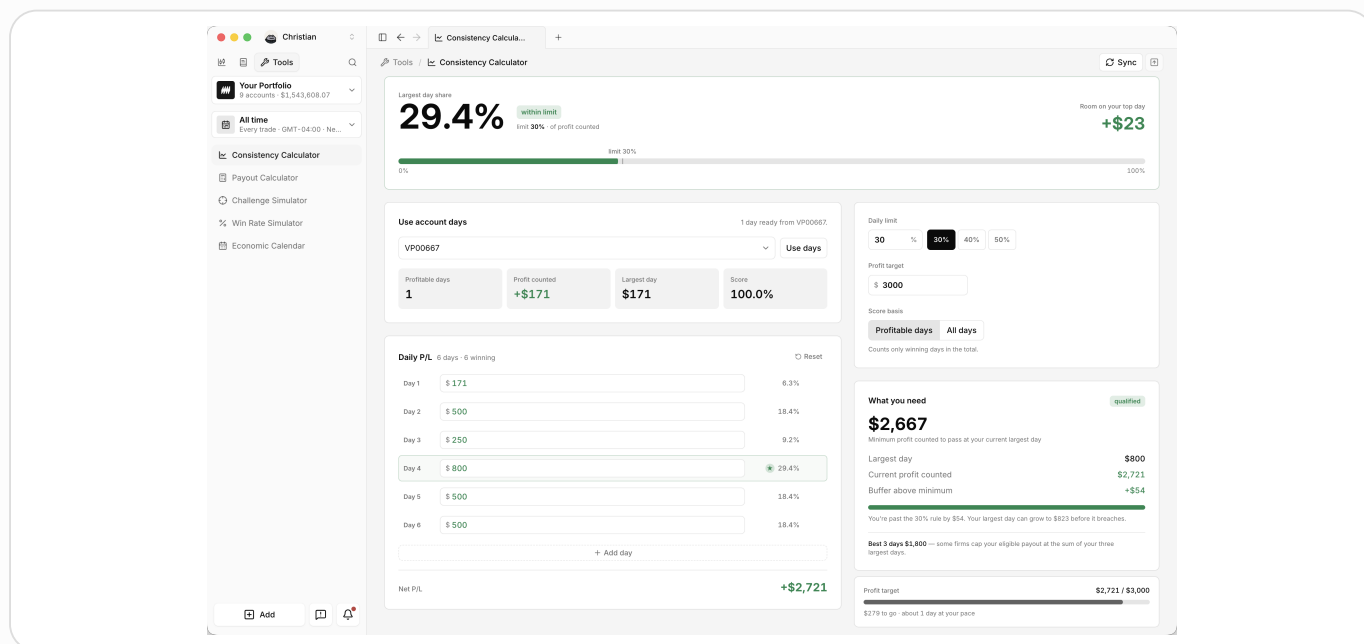

One language across workflows

Reusable account rows, status treatments, money formatting, dialogs, and page actions make unfamiliar tools predictable.

04

Safety before optimism

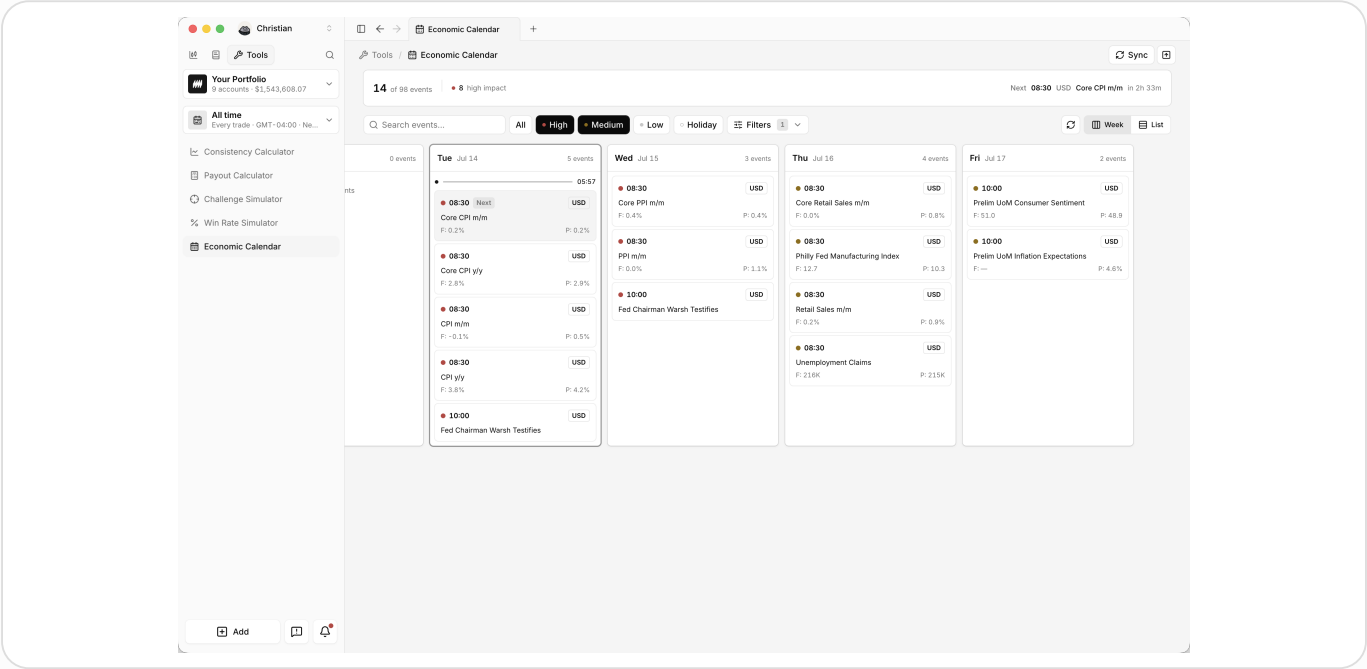

Connection and trading states use explicit status and failure language; unavailable information is never presented as a guarantee.

The consistency calculator explains the threshold, current score, and exactly what the trader needs next.

The interface is the system.

trackmyprop uses React, TypeScript, Tailwind CSS, Electron, and reusable accessible foundations. Shared tokens separate page, card, sidebar, overlay, and state layers; reusable patterns cover controls, dialogs, data rows, navigation, and status feedback.

A weekly economic calendar keeps event risk beside the trader's other operating tools.

DOMAIN EXPERIENCE

Tradara	Software Engineer	Aug 2026
thePropTrade	Head of Community	2025 - 2026
PipFarm	Community + Affiliate Manager	2025
PokerDAO	Community Manager	2022 - 2024

Let's build a trading product that feels clear.
